Allowable Subject Matter

Claims 1 – 42 are allowed. The following is a statement of reasons for such an indication.

The prior art of record fail to teach a three-dimensional navigation system and a method, comprising, among other limitations, a processing system which defines subsets of a frequency hopped (ATWD) signal and a center frequency for each subset, bounces the signal off of an object and receives a reflected version of the signal to determine a phase change in the signal, receives reflected versions of the subsets, and subtracts phase effects from the samples that correspond to the center frequency of the subset; the system further stores a pseudo-random frequency order in a memory, changes a transmission frequency of a signal based on the pseudo-random frequency order, uses the order to sample a received signal – thereby generating samples of the received signal – and reorders the samples in an order of increasing frequency; the system further subtracts phase rotations from the corresponding samples according to the time order and wavelength of the sample to thereby reduce effects of motion of the navigation system on the interpretation of the received signals; wherein the method using an Active Traveling-Wave Device (ATWD) during vehicle movement to obtain features along and to the sides of a movement path, comparing the obtained information to determine successive different match points representing different ground locations, determining the range and range rate of each of the matched points.
